

**the pioneer in the
development of
modern open web
framing systems**

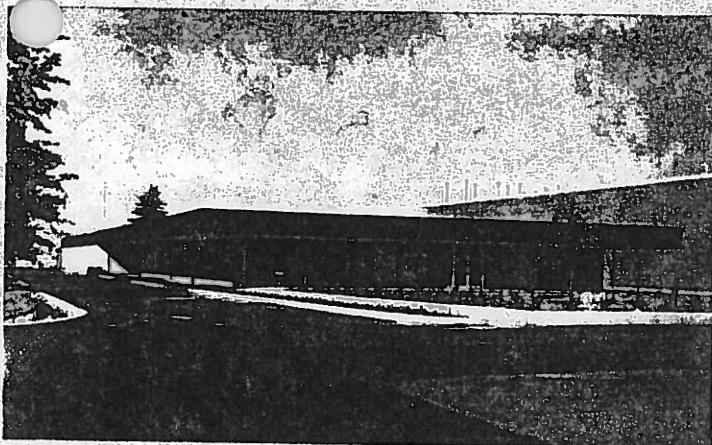

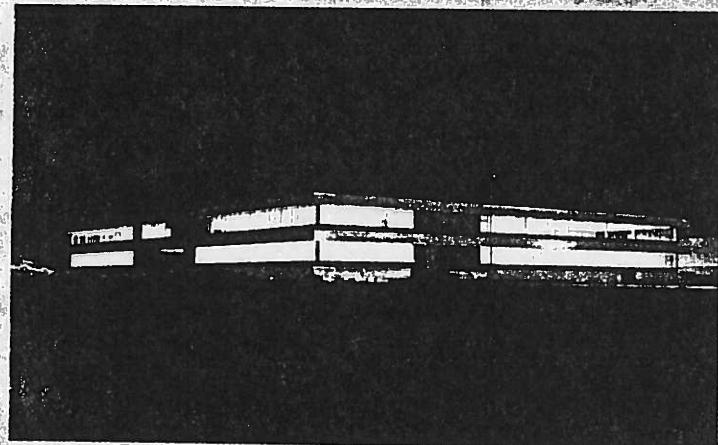

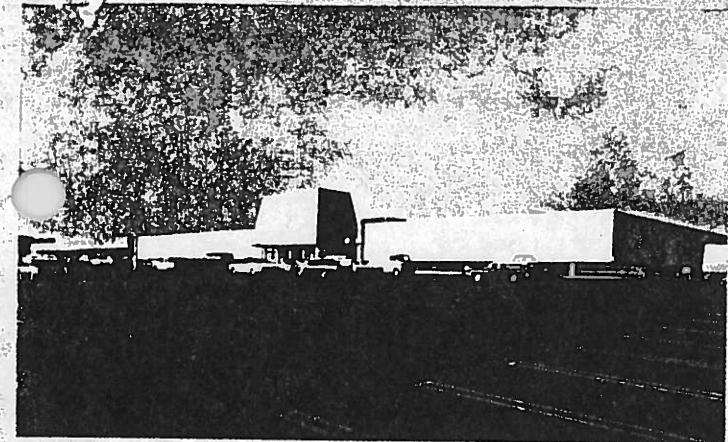

The origin of modern open web framing systems was Macomber's development of the first open web steel joist in 1923.

Every major improvement of open web structural framing components since then has been pioneered by Macomber.

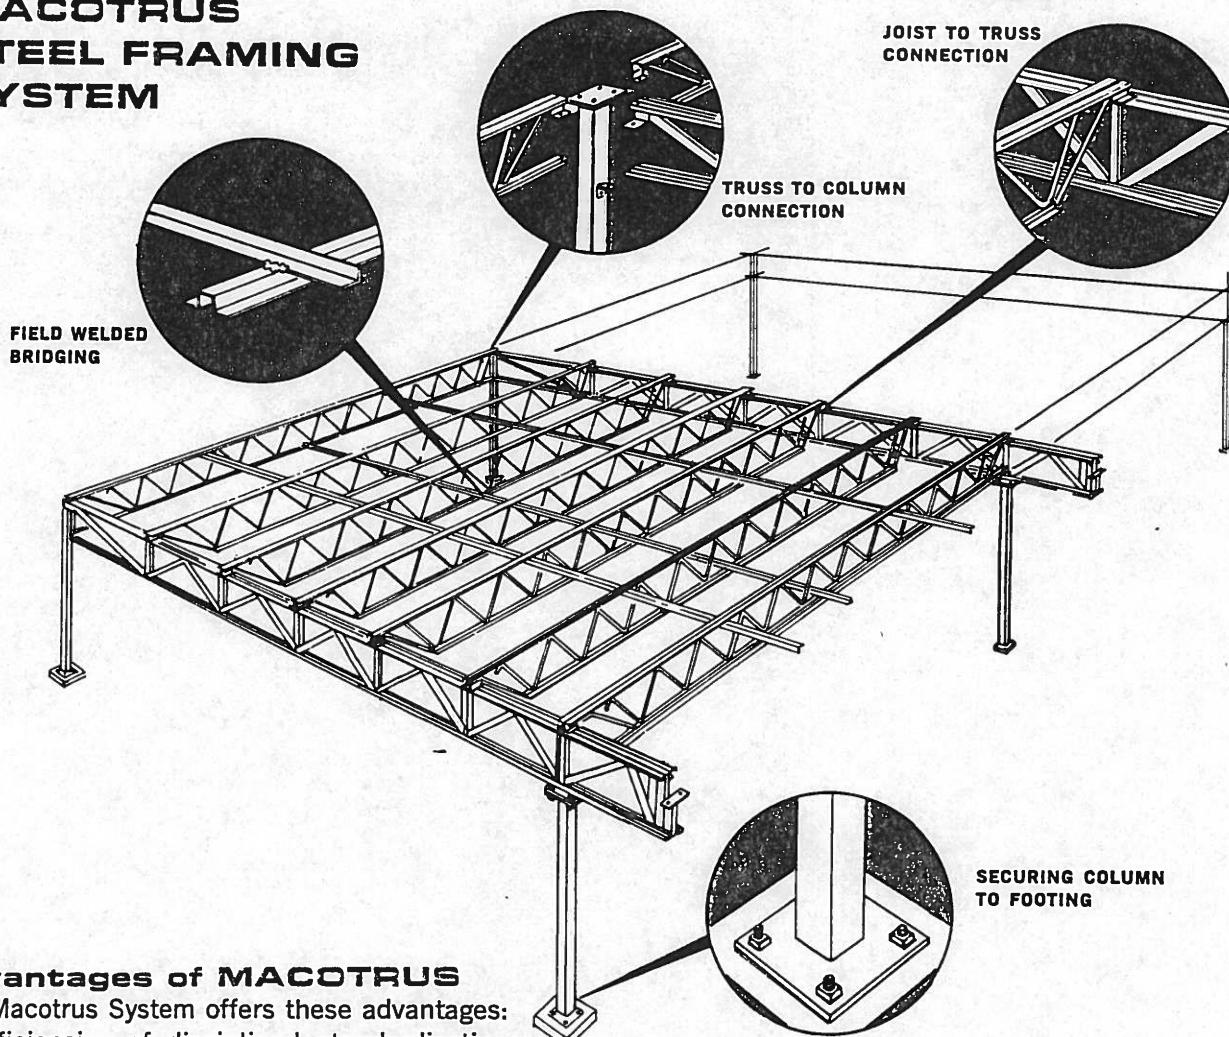

Open web steel framing systems have been accepted throughout the western world among architects and engineers, providing clients with economical steel systems that are architecturally attractive and structurally sound.

Through engineering redesign and standardization, Macomber has developed an improved system programmed to effect the most efficient usage of each component. These economies will result in direct cost savings to the customer, faster delivery and erection time, while still maintaining the same Macomber time-proven engineering and quality excellence.

This catalog has been prepared to assist you in utilizing the Macomber open web framing system to its fullest advantage, both structurally and economically.

MACOTRUS STEEL FRAMING SYSTEM

advantages of MACOTRUS

- The Macotrus System offers these advantages:
1. Efficiencies of disciplined standardization result in cost savings to the customer.
 2. Strength and rigidity of frame is due to utilization of Macomber high strength cold roll formed sections throughout its components.
 3. Economy is realized through high strength to weight ratio of the joist design.
 4. Macotrus allows the use of larger bay sizes. Savings on labor costs result from fewer columns to erect.
 5. Erection is simple, fast and economical.
 6. Relatively rigid girder to column connections insure stiffness, strength and stability under service conditions.
 7. The open web feature of purlins and Macotrus permits penetration of mechanical and electrical services. This feature eliminates unsightly suspended ducts and conduits which interfere with clear heights.

dimensional freedom

The Macomber Macotrus System is available for five planning modules or joist spacings. These spacings — 5'-0", 5'-6", 6'-0", 6'-3" and 6'-8" — satisfy most framing requirements. Column spacings along truss lines are in multiples of these modules. Column spacings perpendicular to truss lines may vary, allowing customer complete freedom to suit conditions.

MACOTRUS framing components

The Macotrus System is composed of open web girders, open web joists and tubular columns.

Standard tubular columns designed, formed and fabricated by Macomber support the open web framing system.

Primary framing members are Macotrus Girders. They span between columns and support steel joists. High Strength cold roll formed chords and webs are utilized for components of the girder. Standard Macotrus girders are available in depths of 28", 32" or 36". Deep girder to column connections give exceptional rigidity on simple span conditions.

Use of cantilevered girders may provide a more economical roof framing for buildings requiring larger clear areas.

Open web steel joists are the secondary members. They bear on the top chord of the Macotrus Girders and span between the girders to support steel roof or floor deck.

High strength cold roll formed sections are utilized as top and bottom chords for Macomber joists.

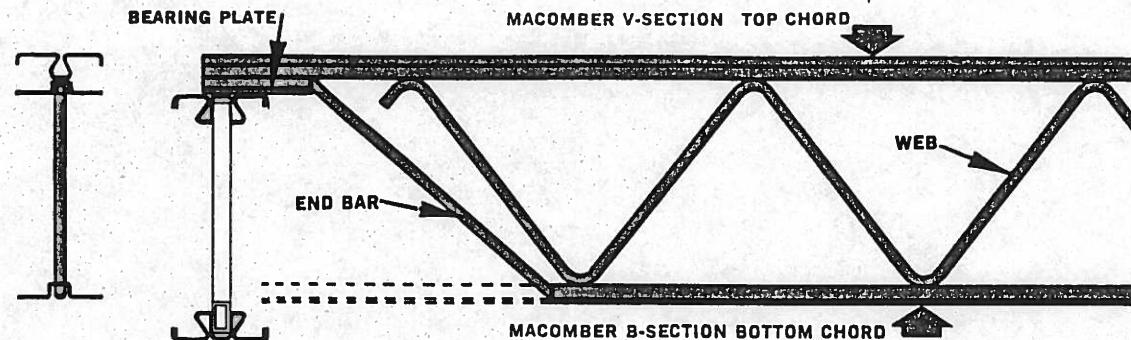

A complete range of open web joists is available for use, depending on loading requirements. The joists may be bolted or welded to the top chord of the girders.

MACOTRUS framing systems

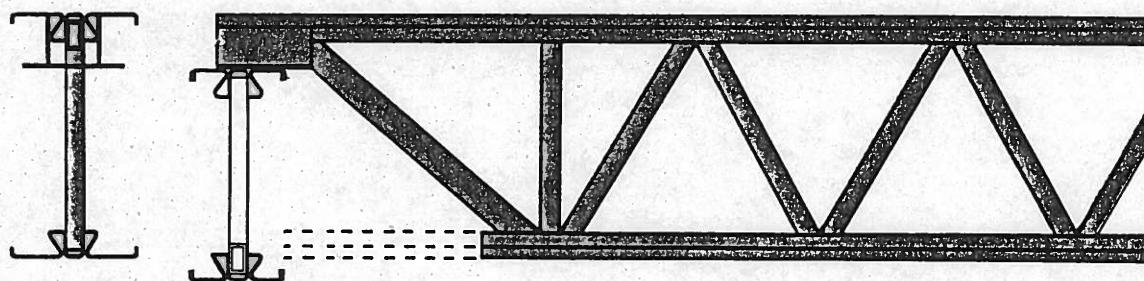

standard open web joists

Open web joists consist of chords, bearing plates, end bars and web system. The open web design provides a freeway for duct, pipe and conduit installations.

1½" V-Section chords are generally used for joists under uniform loading for spans to 56 feet.

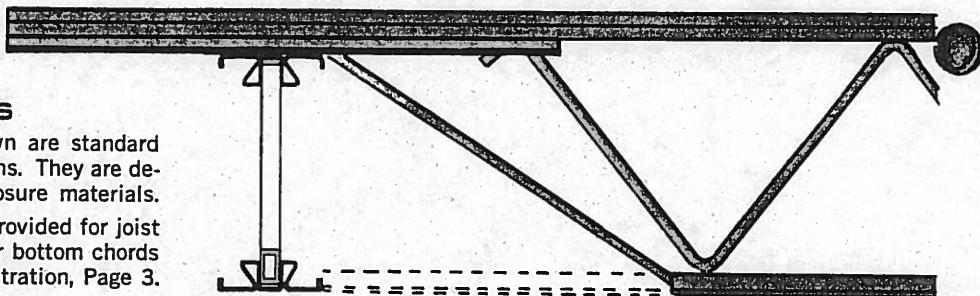

The Macomber VV-Section chords and rectangular tube webs are used for spans over 40 feet, depending on loading conditions.

extended top chords

Open web joist extended top chords as shown are standard components, subject to architectural dimensions. They are designed for easy attachment of fascia and closure materials.

Dotted line shows extension of bottom chord provided for joist at column line and for lateral support of girder bottom chords in compression. Refer to typical framing illustration, Page 3.

how to use the load tables

OPEN WEB JOISTS, Pages 8 through 11:

Multiply the required total load per square foot by the joist spacing to determine the total load per lineal foot of joist. Under the proper "Clear Span in Feet" column, select the joist with the smallest size top chord, whose capacity equals or exceeds the required load per lineal foot. If there is a limitation on the joist depth, select the joist having the maximum allowable depth.

OPEN WEB GIRDERS, Pages 12 through 15:

Determine the load on the girder from each joist by multiplying the total load per lineal foot of joist by one-half of the span. Remember there are usually two joists at each connection, one coming from each side of the girder. The total load at the connection, from both joists, equals "P" in the formulas for bending moments and reactions on Page 6.

Determine the required bending moment and reaction from the formulas, being careful to choose the proper formula according to the number of joist

spaces in the length of the girder. Note that girder span "L" is the distance from center to center of column.

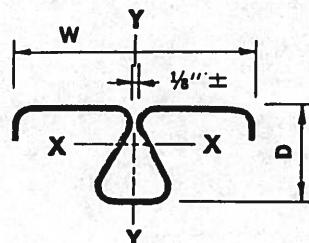

Resisting moments and allowable shears for standard simple span girders are found on page 12. For standard cantilever girders refer to the tabs on either page 13 or 14, depending on the module used. Select the deepest and smallest chord size girder capable of carrying these bending moments and reactions within the existing limitations of depth.

STANDARD COLUMNS, Page 7:

Determine the total load to be supported by the column. Under the heading for the longest unbraced height along either axis of the column, select the lightest size which will carry the required load.

If the column must resist wind forces or other loads inducing bending, refer to the AISC Specifications governing combined stresses for determining proper column sizes.

Load capacities are determined in accordance with American Institute of Steel Construction Specification adopted February 12, 1969.

K = 1.5*

Max. KL/r = 200

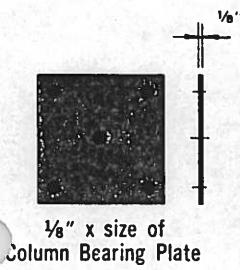

Fy = 36 ksi.

Max. KL/r = 120 for clear heights to left of heavy line.

E = 29,500 ksi

*(Effective lengths have been determined by multiplying clear heights times "K".

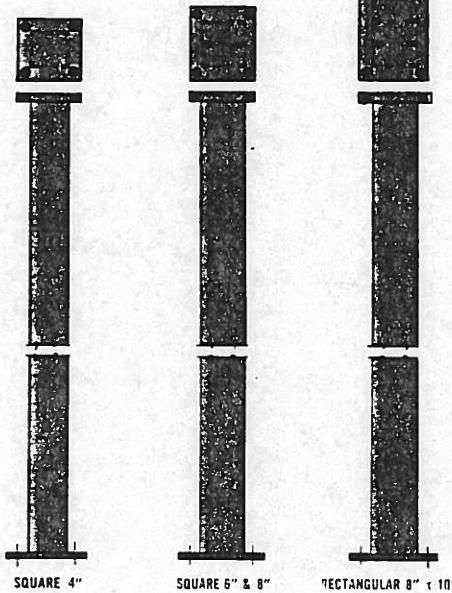

Other "K" values may be used provided job conditions permit. Refer to above AISC Specification)

ALLOWABLE LOADS TO THE RIGHT OF THE LINE ARE DETERMINED BY THE CHORDS.
ALLOWABLE LOADS TO THE LEFT OF THE LINE ARE DETERMINED BY THE END REACTION.

V Series (recommended bridging lines for open web joists)

| 1 Row | 6-12 | 7-14 | 8-16 | 9-18 | 10-20 | 11-22 | 12-24 | 13-26 | 14-28 |
|--------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| 2 Rows | 12-18 | 14-21 | 16-24 | 18-27 | 20-30 | 22-33 | 24-36 | 26-39 | 28-42 |
| 3 Rows | Over 18 | Over 21 | Over 24 | Over 27 | Over 30 | Over 33 | Over 36 | Over 39 | Over 42 |

VV series (recommended bridging lines)

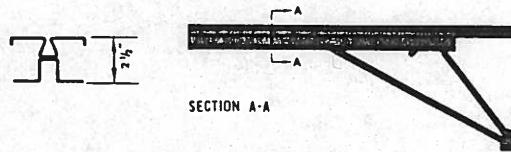

| 1 Row | 18-36 | 20-40 | 25-50 |
|--------|-------|-------|-------|
| 2 Rows | 36-54 | 40-60 | 50-72 |
| 3 Rows | 54-72 | 60-72 | |

Table lists Top Chord Bridging for Floors and Roofs,
Bottom Chord Bridging for Floors.

For Bottom Chord Bridging in Roofs, use one line of Bridging
only where 2 or 3 Top Chord Rows are required.

NOTE: Capacities to the left of break line are governed by stress, those to the right by deflection of L/120.

**Refer to page 5 for
Open Web Joist Chord size.**

VV Series Extended End Load Table

NOTE: Capacities to the left of break line are governed by stress, those to the right by deflection of 1/120.

load table-dimensions and properties of VV-Series extended ends

NOTE: Capacities to the left of break line are governed by stress, those to the right by deflection of L/120. The allowable uniform load in pounds per lineal foot of extended end shall not exceed the allowable uniform load for the member to which it is attached.

MACOTRUS framing and specifications

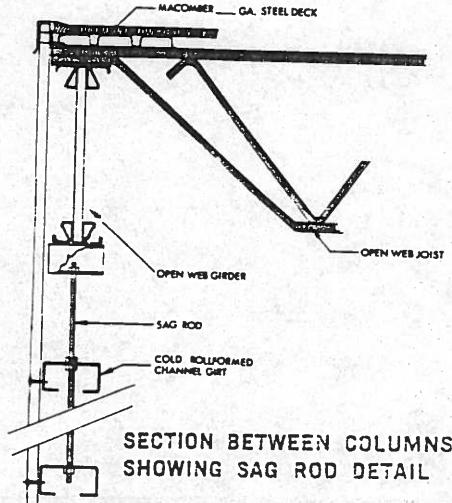

WALL — FACILITATING FUTURE CONSTRUCTION

SECTION THROUGH OVERHEAD DOOR OPENING

SECTION AT EXTENDED TOP CHORD

SECTION BETWEEN COLUMNS SHOWING SAG ROD DETAIL

recommended specifications

MACOTRUS framing

The work covered by this section shall include all labor, materials, equipment and services necessary for and incidental to the installation of the steel framing complete in accordance with this specification and applicable drawings.

Structural steel shall be completely integrated, free standing open web framing system as manufactured by Macomber Incorporated of Canton, Ohio, or approved equal; and shall consist of columns, base plates, leveling plates, foundation bolts, girders, purlins, bridging, and bracing. Details for connection to masonry, headers, canopies, etc. shall be as shown on drawings.

Top chords of purlins shall be nailable V-Sections, with nail holding capacity at least equal to that of wood.

Bridging shall be horizontal angle bridging field welded to joist top and bottom chords. Bracing shall be in accordance with good engineering practice, per manufacturer's recommendation, and as indicated on shop drawings.

Framing shall be expandable, with minor modifications except where limited by finished masonry walls, etc.

Manufacturer of a proposed alternate system must submit to the architect, at least five days before bid opening, design and test data proving his system to be equal in structural capacity, rigidity, and nailability.

Manufacturer of structural system to be used by general contractor shall submit shop drawings for approval by the architect.

All structural framing shall receive one shop coat of manufacturer's standard paint.

alternate in lieu of standard structural

Contractor will submit figures showing addition or deduction for furnishing a complete open web structural system as manufactured by Macomber Incorporated of Canton, Ohio, in lieu of standard structural members specified. The open web framing system shall be structurally capable of carrying load requirements dictated by the architect and the engineer. Necessary architectural modifications shall be subject to the approval of the architect. Shop drawings and substantiating data, when requested, shall be prepared by Macomber Incorporated, approval by the architect and engineer.

All structural framing shall receive one shop coat of manufacturer's standard paint.

(For 12" Width)

for wind and seismic loadings-diaphragm action

The greater part of all buildings constructed throughout North America are influenced to some degree by the lateral forces of wind and/or seismic thrust. The presence of these factors requires special consideration in the design of a structure.

Effective in providing the necessary lateral stability is the utilization of steel deck as a horizontal diaphragm. Macomber Intermediate Rib Deck has excellent diaphragm properties. These properties were established

through tests on the Macomber deck, conducted by S. B. Barnes and Associates of Los Angeles, California.

Satisfactory diaphragm action using Macomber steel deck can be obtained without the use of welding washers or side lap welding.

Test data is available by writing to Macomber Incorporated in Canton, Ohio or by contacting the Macomber Representative in your area.
