Solid bodies do not have a name, by default
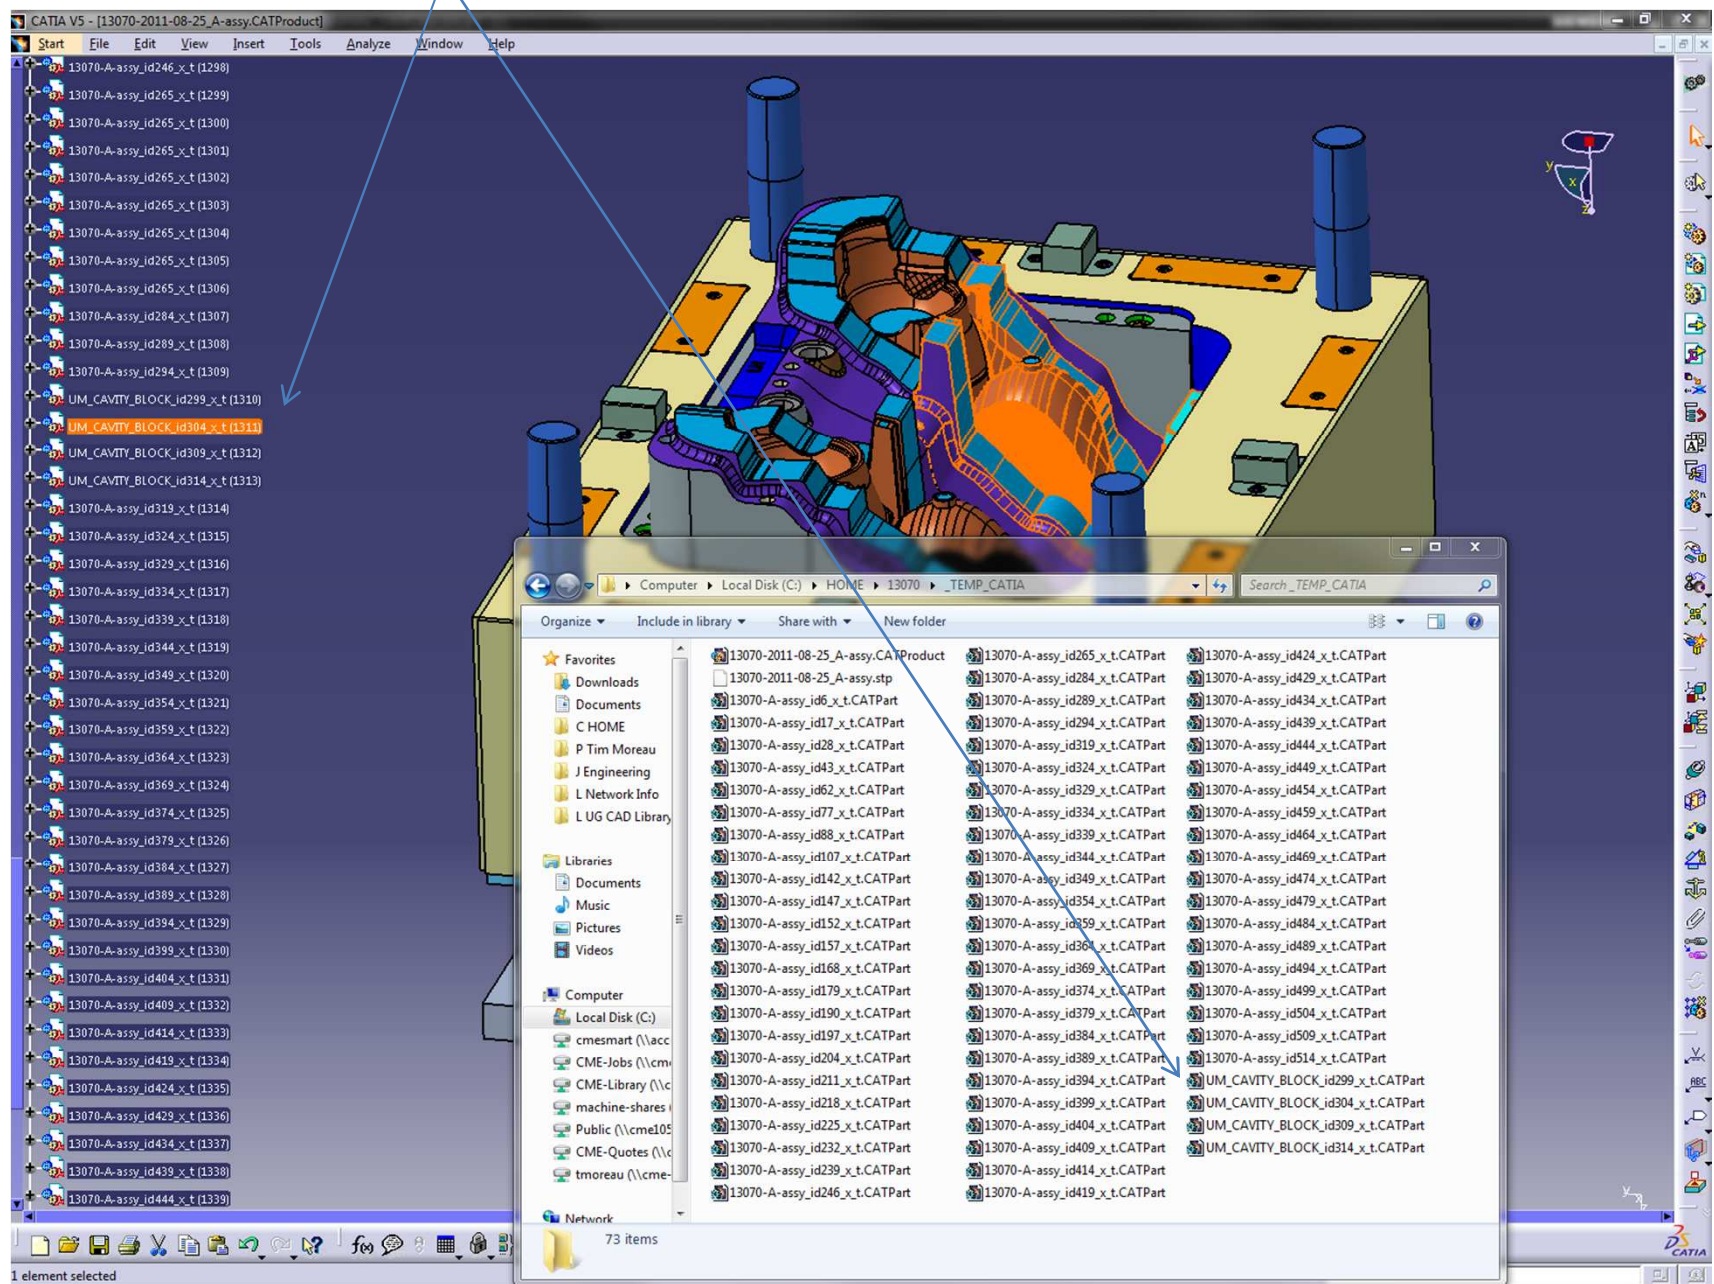

Some moldwizard bodies *are* named

In CATIA, go to Tools, Options, and check the *"One CATProduct for each product"* option (see below) to preserve the assembly structure when importing step files.

The solid body name, if one is assigned, becomes the component
name when imported into CATIA

## What is needed:

A method to assign names to every solid body, using the component name.

Preferably this would be done automatically and dynamically when the STEP file is written for all bodies that do not have an assigned name.
