

Rigid "box", ~~10'x10'x10'~~
10'x10'x10'

Seismic Force

$$F_p = \frac{0.4 a_p S_{DS} W_p}{\left(\frac{R_e}{F_p}\right)} \left[1 + 2 \frac{z}{h} \right]$$

$$= 1.2 W_p$$

"Slip" when seismic > friction. $F_p > \mu W_p$. Assume $\mu = 0.5$
 $1.2 W_p > 0.5 W_p$
 so, 0.7 W_p anchor force required

"Tip" when seismic moment > weight moment

Take moments about heel edge

~~(0.5) Wp~~

Tip when
 $(s')(F_p) > (s') W_p$

$$F_p > W_p$$

$$1.2 W_p > W_p$$

0.2 $W_p (s')$ resisting
 moment required
