

With out common zone

With this dimensioning scheme only a spacing within the pattern of holes is controlled. Orientation and/or location of the pattern relative to some other features is not defined. You may probably want to add datum references to positional tolerance to grab this characteristic + basic dimensions tying the datum features and the pattern together. Position FCF could be something like:

	$\phi 0.2$	A	B	C
---	------------	---	---	---

With common zone

Again, this dimensioning scheme controls only a relationship (spacing) of the holes within the pattern. An additional tolerance has to control orientation and/or location of the pattern relative to other features.
