

Given

A HZ 20W thermopile

Find

Necessary heat transfer for optimum power output

Solution

$$k_{\text{pile}} := 0.024 \frac{\text{W}}{\text{cm} \cdot \text{K}}$$

$$t_{\text{pile}} := 0.508 \text{ cm}$$

$$T_{\text{hot}} := 230 \text{ }^\circ\text{C}$$

$$T_{\text{cold}} := 30 \text{ }^\circ\text{C}$$

$$\Delta T_{\pi} := 200 \text{ K}$$

$$l := 7.5 \text{ cm}$$

$$A := l^2$$

$$Q_{\pi} := k_{\text{pile}} \cdot A \cdot \frac{T_{\text{hot}} - T_{\text{cold}}}{t_{\text{pile}}}$$

$$Q_{\pi} = 531.5 \text{ W}$$

Given

Necessary heat transfer

Find

Heat transfer coefficient and heat fin area

Solution

According to the following website, a smokestack for a schrader wood stove reaches temperatures between 300-400 degrees. No units were provided but the author is from Missouri, so I'll assume Fahrenheit.

<http://www.tractorbynet.com/forums/rural-living/73614-woodstove-pipe-temperature.html>

$$n := 100 \quad A_0 := 16 \text{in}^2$$

$$i := 1..n \quad A_f := 10000 \text{cm}^2$$

$$\text{Area}_i := A_0 + i \cdot \frac{A_f - A_0}{n}$$

$$M := 100 \quad \text{Th}_0 := 300 \text{ } ^\circ\text{F}$$

$$j := 1..M \quad \text{Th}_f := 400 \text{ } ^\circ\text{F}$$

$$\text{Tsmoke}_j := \text{Th}_0 + j \cdot \frac{\text{Th}_f - \text{Th}_0}{M}$$

$$o := 100 \quad \text{Tc}_0 := -40 \text{ } ^\circ\text{C}$$

$$k := 1..o \quad \text{Tc}_f := 70 \text{ } ^\circ\text{F}$$

$$\text{Tair}_k := \text{Tc}_0 + o \cdot \frac{\text{Tc}_f - \text{Tc}_0}{k}$$

$$\text{hsmoke}_{i,j} := \frac{Q_\pi}{\text{Area}_i \cdot (\text{Tsmoke}_j - \text{T}_{\text{hot}})}$$

$$\text{hair}_{i,k} := \frac{Q_\pi}{\text{Area}_i \cdot (\text{T}_{\text{cold}} - \text{Tair}_k)}$$

hsmoke

hair
