MACOMBER INCORPORATED

CANTON, OHIO 44701

SUBSIDIARY OF SHARON STEEL CORPORATION

THE MACOMBER V-BEAM

A DEPENDABLE JOIST FROM A RELIABLE MANUFACTURER

The Macomber V-BEAM is the product of more than forty years of leadership in the steel building field. V-BEAMS are engineered to provide you with unexcelled performance and quality. The performance and design of this member is verified by the results of more than a thousand load tests on full size joists, conducted since 1950 in the V-BEAM development sequence. In addition, the success of hundreds of thousands of V-BEAMS on the job lends proof to our claims for this product.

SUGGESTED SPECIFICATION

Steel joists shall be designed to support the live and dead loads shown on the drawings and shall have factor of safety and live load deflections as follows:

Roof Joists

Factor of safety 1.65. Maximum live load deflection 1/360 - 1/240 or 1/180 of span.

Floor Joists

Factor of safety 1.65. Maximum live load deflection 1/360 of span.

See footnotes of V-BEAM load table for limitations on use of this member as floor joist.

The clear span of all joists shall not exceed 550 times the top chord radius of gyration about the vertical axis.

The Macomber V-BEAM is available in depths from 8" to 28" and in spans to 56'. The V-BEAM is made with cold rollformed chords. The Macomber V-Section is utilized as the top chord and a Macomber B-Section serves as the bottom chord, providing the joist with unusual lateral stability. The chords are proportioned in accordance with the latest AISI specifications.

It will be to your advantage to check on the V-BEAM for use in your next project, it's a dependable joist. For information, help, or a quotation on your needs, call or write to the Macomber representative nearest you.

Paint

Joists and accessories shall be painted one shop coat of manufacturer's standard protective paint which can be readily field painted in exposed areas without bleeding through.

Inspection and Test Reports

The joist manufacturer must provide resident inspection of his production by a nationally recognized independent testing laboratory, in addition to the product inspection done by his own forces. The manufacturer must submit, with his approval drawings, representative certified reports by such independent testing laboratory covering tests of his joists, as proof of the performance and quality of workmanship of his products.

If the manufacturer does not have resident testing laboratory inspectors in his plant, he may provide independent testing laboratory inspection of this specific project continuously during manufacture; and make load tests, supervised by that testing laboratory, of one out of every 50 joists (including one joist of each different top chord size and depth) to prove compliance with the safety factor and live load deflection requirements of this specification.

Bridging

Bridging shall be horizontal angles or other shapes, attached to the chords by welding or other mechanical means. The slenderness ratio of the bridging between joists shall not

exceed 300. The slenderness ratio of the joist top chord between bridging lines shall not exceed 150. The slenderness ratio of the bottom chord between bridging points shall not exceed 150 for floor joists or 300 for roof joists.

Erection

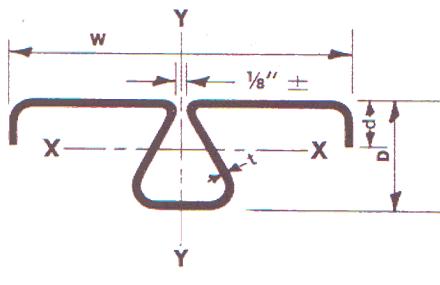

Joists shall be carefully handled to prevent damage. Joists shall be accurately spaced, anchored, and completely bridged prior to the application of construction loads.

Deflections

The V-BEAM load table shows maximum live loads for deflection limits of 1/360 and 1/240 of the span.

V-BEAM DESIGN

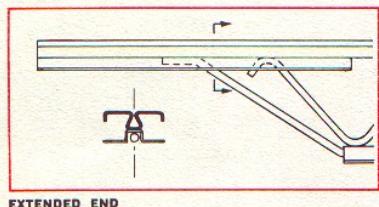

With this, the latest in the series of V-BEAMS, Macomber continues its leadership in the steel building field. This member embodies the experience gained since 1950 when Macomber introduced the original V-BEAM to the market. Development of the V-BEAM is based on information from the great number of tests performed on full sized members, since that date.

The V-BEAM top chord, consisting of the V-Section, has been in constant use on all Macomber products since 1946. Test data and engineering information on this section support its usage. The B-Section making up the bottom chord has been in use since 1960 in the Macomber "S" series joists, and more recently in the J & H series joists. The information gathered justifies its use in the V-BEAM.

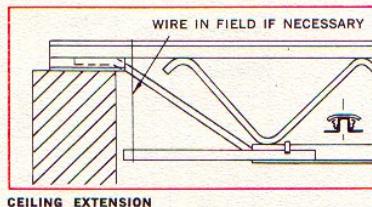

The components of the V-BEAM — chords, bearing plates, end bars and web system — lend themselves admirably to modern fabricating standards and Macomber's up-to-date fabricating facilities.

In preparing the load tables, it was recognized that under some conditions, the deflection of a member governs its design. To simplify the selection of V-BEAMS under these conditions, additional loads, in color, have been incorporated listing the live load carrying capacities for each joist size and span, for limiting deflections of 1/360 and 1/240 of the span.

WHERE LIVE LOAD IS NOT INDICATED, LIVE LOAD CAPACITY EQUALS TOTAL LOAD CAPACITY.

CARRYING CAPACITIES TO RIGHT OF HEAVY LINE ARE GOVERNED BY RESISTING MOMENT OF CHORDS.

CARRYING CAPACITIES TO LEFT OF HEAVY LINE ARE GOVERNED BY THE END REACTION.

SPANS TO THE RIGHT OF THE DASHED LINES ARE TO BE USED FOR ROOF CONSTRUCTION ONLY.

WHERE LIVE LOAD IS NOT INDICATED, LIVE LOAD CAPACITY EQUALS TOTAL LOAD CAPACITY.
 CARRYING CAPACITIES TO RIGHT OF HEAVY LINE ARE GOVERNED BY RESISTING MOMENT OF CHORDS.
 CARRYING CAPACITIES TO LEFT OF HEAVY LINE ARE GOVERNED BY THE END REACTION.
 SPANS TO THE RIGHT OF THE DASHED LINES ARE TO BE USED FOR ROOF CONSTRUCTION ONLY.

QUALITY CONTROL

In serving the architects, engineers and contractors of America, Macomber Incorporated has developed a quality control program unequalled in the industry. Macomber open-web steel joist production is regularly checked by inspectors of the Pittsburgh Testing Laboratory.

As an added quality control measure, Macomber maintains a full force of product inspectors. These inspectors are responsible to the Director of Quality Control.

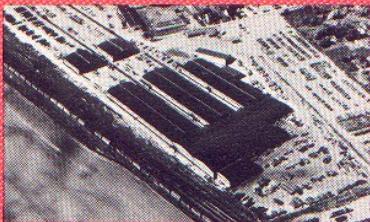

All production welding is performed by personnel certified by the Pittsburgh Testing Laboratory.

The customer purchasing Macomber open-web steel framing products produced under this program is assured that these products will perform as he has a right to expect.

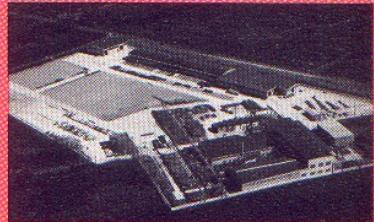

MACOMBER FABRICATING FACILITIES

CARNAHAN PLANT
CANTON, OHIO

FAIRHOPE PLANT
CANTON, OHIO

ROCK ISLAND PLANT
ROCK ISLAND, ILLINOIS

MACOMBER PRODUCTS ARE ALSO MANUFACTURED
IN ENGLAND, FRANCE AND CANADA . . .
