

STEP ZERO

ptrCallback if defined in Midilnopen.

STEP ONE

I think I should define in VFP a class (**VB Public Delegate Function**):

MidilnCallback(hMidiln as INTEGER,wMsg AS UNSIGNED INTEGER (so an INTEGER) ,dwInstance as INTEGER,dwParam1 as INTEGER,dwParam2 AS INTEGER) **as integer**

STEP TWO

Second I should create in VFP a Procedure/Function MidilnProc:

MidilnProc(hMidiln,wMsg,dwInstance,dwParam1,dwParam2)

display data using dwParam1

ENDFUNCTION

STEP THREE

Create in VFP a new object based on **MidilnCallback**(see step one) with address to MidilnProc according step two. This should return the pointer to the new callback.

ptrCallback=CREATEOBJECT("MidilnCallback", address of **MidilnProc**)

Final remark: So we have two pointers: ptrCallback and Address of MidilnProc.
