

### ARCO A 3 CERNIERE

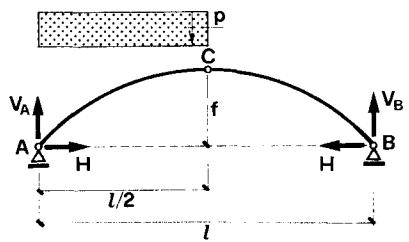

$$V_A = \frac{Pb}{l} \quad V_B = \frac{Pa}{l}$$

$$H = \frac{Pa}{2f} \quad \left( \text{valida per } a \leq \frac{l}{2} \right)$$

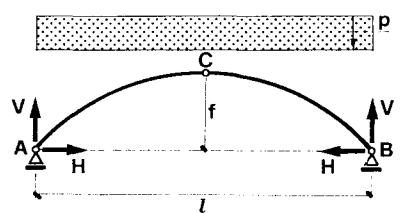

$$V = \frac{Fh}{l}$$

$$H_B = \frac{Fh}{2f} \quad H_A = F - H_B$$

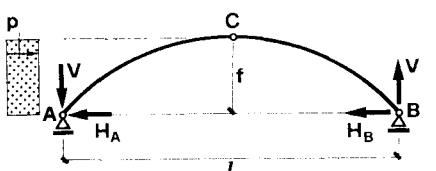

$$V_A = \frac{3}{8} pl \quad V_B = \frac{1}{8} pl$$

$$H = \frac{pl^2}{16f}$$

$$V = \frac{pl}{2}$$

$$H = \frac{pl^2}{8f}$$

$$V = \frac{pl^2}{2l}$$

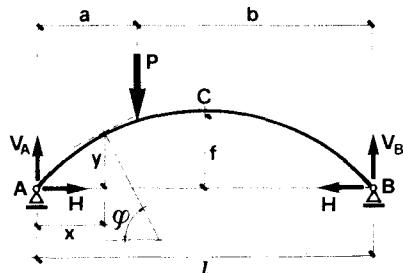

$$H_A = \frac{3}{4} pf \quad H_B = \frac{1}{4} pf$$

Le formule contrassegnate con asterisco (\*) sono valide per arco a forma parabolica con:

$$y = \frac{4fx(i-x)}{l^2} \quad J_c = \frac{J_0}{\sin \varphi}$$

$$J_0 = \text{momento di inerzia in chiave} \quad \alpha = \frac{a}{l} \quad \beta = \frac{b}{l}$$

Per gli archi ribassati tale ipotesi coincide praticamente con quella della sezione costante.

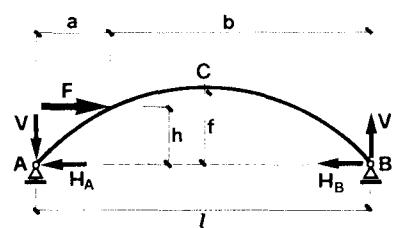

$$V_A = P\beta \quad V_B = P\alpha$$

$$H = \frac{5}{8} \frac{Pl}{f} \alpha \beta (1 + \alpha \beta) (*)$$

$$M_C = \frac{Pa}{2} - Hf \quad (\text{per } a \leq \frac{l}{2})$$

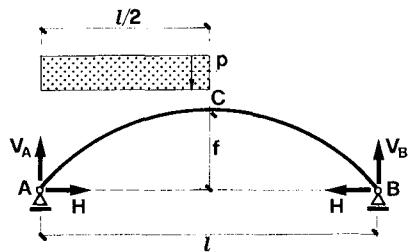

$$M_C = \frac{Pb}{2} - Hf \quad (\text{per } a > \frac{l}{2})$$

$$V = \frac{Fh}{l}$$

$$H_A = \frac{F}{2} \beta (2 - 3\alpha + 2\alpha^2 + 12\alpha^3 - 8\alpha^4) (*)$$

$$H_B = F - H_A \quad M_C = \frac{Fh}{2} - H_B f$$

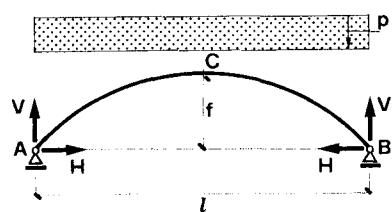

$$V_A = \frac{3}{8} pl$$

$$V_B = \frac{1}{8} pl$$

$$H = \frac{pl^2}{16f} (*)$$

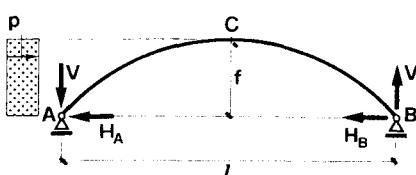

$$M_C = \frac{pl^2}{16} (*)$$

$$V = \frac{pl}{2}$$

$$H = \frac{pl^2}{8f} (*)$$

$$M_C = 0 (*)$$

$$V = \frac{pf^2}{2l}$$

$$H_A = \frac{5}{7} pf f (*) \quad H_B = \frac{2}{7} pf f (*)$$

$$M_C = -\frac{1}{28} pf^2 (*)$$

## ARCO INCASTRATO

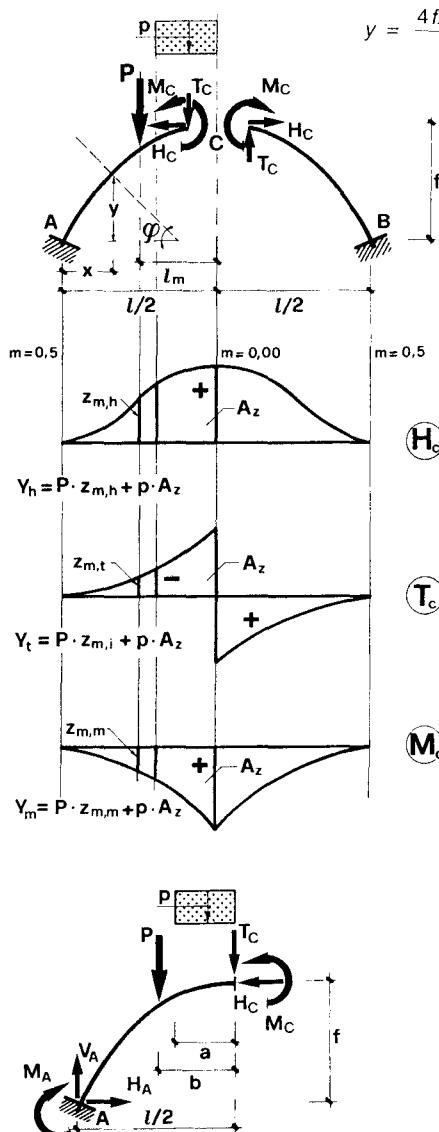

Le formule contrassegnate con asterisco (\*) sono valide per arco a forma parabolica con:

$$y = \frac{4fx(l-x)}{l^2} \quad J_x = \frac{J_0}{\sin \varphi}$$

$$J_0 = \text{momento di inerzia in chiave} \quad \alpha = \frac{a}{l} \quad \beta = \frac{b}{l}$$

Per gli archi ribassati tale ipotesi coincide praticamente con quella della sezione costante.

	$H = \frac{15}{4} \frac{Pa}{f} \alpha \beta^2 (*)$ $M_A = - \frac{Pa}{2} \beta^2 (5\beta - 3) (*)$ $M_B = - \frac{Pb}{2} \alpha^2 (5\alpha - 3) (*)$ $V_A = P\beta - \frac{M_A - M_B}{2} \quad V_B = P - y_A$ $M_C = M_B + \frac{1}{2} y_B l - Hf \quad (\text{vale per } a \leq \frac{l}{2})$
	$H_A = F\beta (1 + \alpha - 14\alpha^2 + 36\alpha^3 - 24\alpha^4) (*) \quad H_B = F - x_A$ $M_A = - 2Ff\alpha\beta^2 (3 - 9\beta + 8\beta^2) (*)$ $M_B = 2Ff\alpha^2\beta (3 - 9\alpha + 8\alpha^2) (*)$ $V_A = V_B = \frac{Fh + M_A - M_B}{l}$ $M_C = \frac{yI}{2} - H_B f + M_B$
	$H = \frac{pl^2}{16f} (*)$ $M_A = - \frac{1}{64} pl^2 (*) \quad M_B = + \frac{1}{64} pl^2 (*)$ $V_A = \frac{13}{32} pl \quad V_B = \frac{3}{32} pl$ $M_C = 0 (*)$
	$H_A = H_B = \frac{pl^2}{8f} (*) \quad M = 0 (*)$ $V_A = V_B = \frac{pl}{2} \quad M_C = 0 (*)$
	$H_A = \frac{11}{14} pf (*) \quad H_B = \frac{3}{14} pf (*)$ $M_A = - \frac{51}{280} pf^2 (*) \quad M_B = \frac{19}{280} pf^2 (*)$ $M_C = - \frac{3}{140} pf^2 (*) \quad V_A = V_B = \frac{pf^2}{4l}$

**Arco incastrato comunque caricato con carichi verticali****Incognite iperstatiche in chiave**

$$H_C = Y_h \cdot \frac{l}{f}$$

$$T_C = Y_t$$

$$M_C = Y_m - Y_h \cdot \frac{f}{3}$$

dove  $Y_h$ ,  $Y_t$ ,  $Y_m$  sono coefficienti calcolati come prodotto dei carichi concentrati  $P$  per le ordinate  $z_{m,i}$  dei diagrammi, ovvero come prodotto del carico ripartito  $p$  per le aree sottese sui medesimi diagrammi.

**Reazioni vincolari**

$$H_A = H_C$$

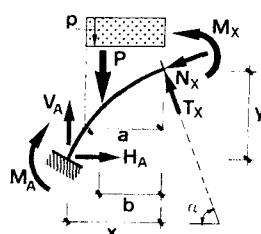

$$V_A = T_C + P + p \cdot a$$

$$M_A = M_C + H_C \cdot f - T_C \cdot \frac{l}{2} - P \cdot \left( \frac{l}{2} - b \right) - \frac{p \cdot a}{2} \cdot (l-a)$$

sul semiarco ove non esista carico si pone  $P=0$   
e/o  $p=0$ .

**Valori delle ordinate z**

$m$	$z_{mh}$	$z_{mt}$	$z_{mm}$
0,00	0,23438	0,50000	0,12500
0,05	0,22971	0,42525	0,10125

0,40	0,03038	0,02800	0,00500
0,45	0,00846	0,00725	0,00125
0,50	0,00000	0,00000	0,00000

**Determinazione delle caratteristiche di sollecitazione su sezioni qualsiasi**

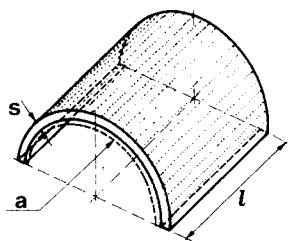

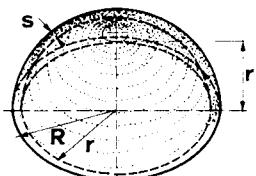

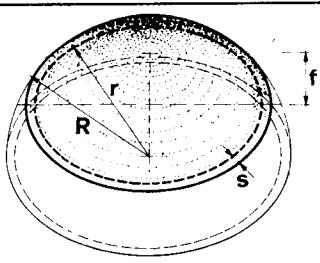

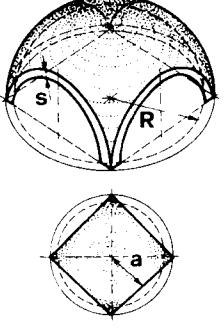

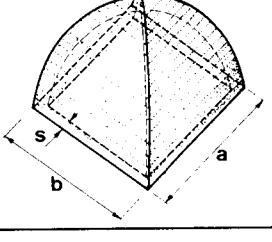

$$N_i = H_A \cdot \sin \alpha + V_A \cdot \cos \alpha - P \cdot \cos \alpha - p \cdot a \cdot \cos \alpha$$

$$T_i = V_A \cdot \sin \alpha - H_A \cdot \cos \alpha - P \cdot \sin \alpha - p \cdot a \cdot \sin \alpha$$

$$M_i = M_A + V_A \cdot x - H_A \cdot y - P \cdot b - p \cdot \frac{a^2}{2}$$

Vedi anche in PRONT: "Arco con carichi distribuiti e concentrati" nella PARTE I - Caratteristiche di sollecitazione e spostamenti.

**TABELLA MUR.13 - SUPERFICI E VOLUMI DELLE VOLTE**

denominazione	superficie	volume	geometria
Volta a botte	$S = a \cdot l$	$V = a \cdot l \cdot s$	
Volta a bacino	$S = 2\pi r^2$	$V = 2,094 (R^3 - r^3)$	
Volta sferica ad arco scemo	$S = 2\pi r f$	$V = 2,094 \frac{f}{r} (R^3 - r^3)$	
Volta a vela a tutto sesto	a base: quadrata $S = 1,30 a^2$ pentagona $S = 2,37 a^2$ esagona $S = 3,76 a^2$ ottagona $S = 7,46 a^2$ decagona $S = 12,42 a^2$ rettangola $S = 3,14 R(a + b - 2R)$	$V = S \cdot s$ circa	
Volta a padiglione	$S = 1,14 (a \cdot b)$	$V = S \cdot s$ circa	
Volta a crociera a tutto sesto	$S = (a + b) \cdot f + (a \cdot b)$	$V = S \cdot s$ circa
