

# Industrial Gas Generation Sizing guide

ENGINEERING YOUR SUCCESS.

# Nitrogen Gas Generator Sizing and Selection Guide

---

## Important information

### NITROSource PSA Generator Models

- 1) Sizing is based on ambient, (surrounding) air temperature
- 2) Inlet air quality required: \* pressure dewpoint, 0.01 micron particulate and 0.01mg/m<sup>3</sup> oil
- 3) When selecting a generator complete with a pre-treatment package, allow 1 bar(g) pressure differential.  
e.g. if air pressure available is 7 bar(g), allow 7 bar(g) into pre-treatment package and 6 bar(g) into generator inlet port

### Pre-treatment packages

- 1) Sizing is based on inlet air temperature ranges
- 2) To size a pre-treatment package, size the generator, then select pre-treatment package allowing 1 bar(g) pressure differential as described above. Do not forget to include purge flow within the total air inlet requirements.

### Flow Data

- All flow rates are based on a reference m<sup>3</sup> at 20 °C, 1013 millibar absolute and 0 % relative water vapour pressure
- For sizing based on given flow rates specified in Nm<sup>3</sup> (normal metres cubed) at 0 °C, multiply by 1.08 to achieve correct generator selection flow.  
e.g. Flow rate from customers flow meter calibrated in Nm<sup>3</sup>/hr reads 100Nm<sup>3</sup>/hr. Size the generator based upon  
 $100 \times 1.08 = 108 \text{ m}^3/\text{hr}$

---

\* Suggested pre-treatment dryer pressure dew point (pdp) selection where model availability permits  
-20 °C Use for PSA technology generators in general industrial applications  
-40 °C Use for PSA technology generators in food, beverage and pharmaceutical applications  
+3 °C / -70 °C Please Consult Parker.

# NITROSource PSA Sizing example

The following example illustrates how to size a PSA generator:

- 1) Understand the flow, purity and air inlet pressure available
- 2) To allow for pressure drop across pre-treatment package, select the generator inlet pressure 1 bar(g) below air pressure available. For example, if air pressure is 8 bar(g), select the generator based upon 7 bar(g) inlet
- 3) If ambient air temperature is above or below 20°C - 25°C, multiply generator output by the temperature correction factor to obtain revised output
- 4) To calculate air consumption of the generator, multiply output of generator at 20°C - 25°C by air to nitrogen ratio. If calculating flows at other temperatures do not use the revised nitrogen output, only use the nitrogen output at 20°C - 25°C
- 5) To select the correct pre-treatment dryer, choose the unit from dryer selection table based on air inlet temperature and pressure
- 6) To calculate total air consumption, add the dryer purge flow to the nitrogen generator air consumption

## Example 1

|                                       |                      |
|---------------------------------------|----------------------|
| <b>Nitrogen flow rate required</b>    | 30m <sup>3</sup> /hr |
| <b>Food grade application</b>         | 0.1%                 |
| <b>Ambient air temperature</b>        | 20°C                 |
| <b>Factory air pressure available</b> | 7 bar(g)             |

Select the generator based on air available minus 1 bar(g) = 6 bar(g)

At 6 bar(g) air inlet a NITROSource N2-55P will produce 30.9m<sup>3</sup>/h. Air: N2 ratio is 3.4:1. Therefore  $30.9 \times 3.4 = 105\text{m}^3/\text{h}$  air inlet flow requirement to generator.

Selected from dryer table a OFAS HL 70 @ -40°C pdp at 7 bar(g) inlet pressure will flow up to 120m<sup>3</sup>/h outlet with 26.8m<sup>3</sup>/h purge flow.

To calculate total air inlet requirement to pre-treatment package add the generator air inlet flow to the dryer purge flow.  
 $105\text{m}^3/\text{h} + 30\text{m}^3/\text{h} = 135\text{m}^3/\text{h}$

## Example 2

|                                       |                      |
|---------------------------------------|----------------------|
| <b>Nitrogen flow rate required</b>    | 17m <sup>3</sup> /hr |
| <b>Soldering application</b>          | 100ppm               |
| <b>Ambient air temperature</b>        | 35°C                 |
| <b>Factory air pressure available</b> | 8 bar(g)             |

A NITROSource N2-45P will have a reduced flow of  $20\text{m}^3/\text{h} \times 0.88$  (temperature correction factor for 35°C) = 17.6m<sup>3</sup>/h

To obtain air inlet requirement ignore the temperature correction factor so  $20\text{m}^3/\text{h} \times \text{air:N}_2$  ratio for a NITROSource N2-45P is 4.6:1 = 92.2m<sup>3</sup>/hr

As ambient temperature is 35°C the air inlet temperature to the pre-treatment package is likely to be slightly higher, so use the dryer performance at up to 45°C

At up to 45°C CDAS HL 65 @ -20°C with a 8 bar(g) air inlet will have an output flow capability of up to 97.2m<sup>3</sup>/hr with a purge requirement of 26.84m<sup>3</sup>/hr

To calculate the total air inlet requirement to the pre-treatment package add the generator inlet flow to the dryer purge air requirement.  $92.2\text{m}^3/\text{hr} + 22\text{m}^3/\text{h} = 114.2\text{m}^3/\text{h}$

## Energy Saving Technology – EST

### NITROSource PSA energy saving

| Flow Demand (%)                             | 10   | 15   | 20   | 25   | 30   | 35   | 40   | 45   | 50   | 55   | 60   | 65   | 70   | 75   | 80   | 85   | 90   | 95   | 100  |
|---|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| <b>Predicted Average Energy Savings (%)</b> | 71.0 | 65.9 | 61.3 | 57.0 | 53.1 | 49.6 | 46.5 | 43.6 | 41.0 | 38.6 | 36.2 | 33.9 | 31.5 | 29.0 | 26.2 | 23.0 | 19.4 | 15.1 | 10.0 |

#### \*Energy Saving Calculation

Dependant upon exact compressor type and control

To calculate energy savings achievable - calculate NITROSource electrical energy running cost without EST. Then determine average flow demand and multiply energy running cost without EST by % predicted energy saving.

I.E. – NITROSource electrical energy running cost per annum without EST = €8000

Average flow demand = 75%

€8000 x 29% = €2320 saving per annum

**Even at full flow demand, EST can offer electrical running cost savings because the controller calculates exactly how much air is required to produce the correct output flow taking into account all variable internal and external operating parameters.**

# NITROSource PSA performance tables

## Temperature correction factor

| Ambient Temp °C | 5   | 10  | 15   | 20  | 25   | 30   | 35   | 40   | 45   | 50   |
|-----------------|-----|-----|------|-----|------|------|------|------|------|------|

| 10     | 145   | 1.00              |
| 11     | 160   | 1.00              |
| 12     | 174   | 1.00              |
| 13     | 189   | 1.00              |
| 14     | 203   | 1.00              |
| 15     | 218   | 1.00              |
| 16     | 232   | 1.00              |

### Correction Factors - Inlet Dewpoint (CFD)

| CDD Dewpoint | °C           | °F            | Correction Factor |
|--------------|--------------|---------------|-------------------|
| Dry          | -70 to +3    | -100 to +38   | 1.00              |
| Wet          | +3 and above | +38 and above | 4.00              |

It is assumed inlet oil vapour concentration does not exceed 0.05mg/m³ at 35°C (95°F).

For applications with higher oil vapour concentrations, please contact Parker domnick hunter for accurate sizing.

#### Filter Selection - Grade OVR

To correctly select an OVR oil vapour removal filter, the flow rate of the OVR must be adjusted for the minimum operating pressure, maximum operational temperature and pressure dewpoint of the system.

- Obtain the minimum operating pressure, maximum inlet temperature, maximum compressed air flow rate and dewpoint of the compressed air at the inlet of the OVR.
- Select correction factor for maximum inlet temperature from the CFT table to compressor type (always round up e.g. for 37°C use 40°C correction factor).
- Select correction factor for minimum inlet pressure from the CFP table that corresponds type (always round down e.g. for 5.3 bar use 5 bar correction factor).
- Select correction factor for pressure dewpoint from the CFD table.
- Calculate minimum filtration capacity.  
Minimum filtration Capacity = Compressed Air Flow x CFT x CFP x CFD
- Using the minimum filtration capacity, select an OVR model from the flow rate tables above (OVR selected must have a flow rate equal to or greater than the minimum filtration capacity).

If the minimum filtration capacity exceeds the maximum values of the models shown within the tables, please contact Parker domnick hunter for advice regarding larger multi-banked units.
